

Node.JS > INTRODUCTION

TUTORIAL

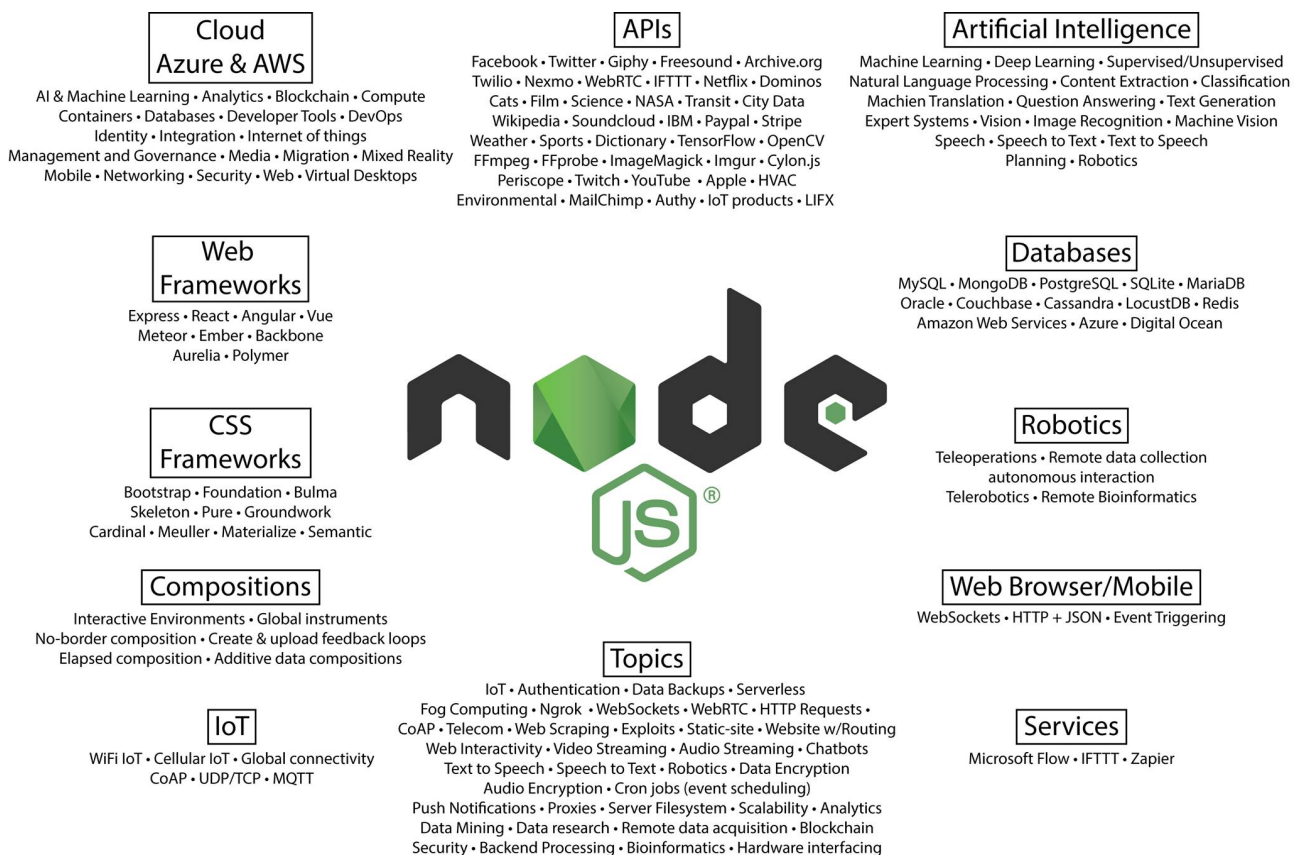

In this tutorial we will build an Multi-Touch Interface which can be used to control Ableton Live.

We will

- get an overview about the possibilities with node.js
- learn the basics of Javascript
- learn how to implement a node.js script in Max for Live
- create a UI with p5.js
- implement a Webserver via node.js
- use Websocket communication protocol to communicate exchange data from client to server

Possibilities of Node.JS

NODE.JS -> Max for Live Showreel -> <https://www.youtube.com/watch?v=qEtONnWOGyo>

Gettings Started:

- <https://cycling74.com/articles/node-for-max-intro---let's-get-started>
- Node for Max Documentation -> <https://docs.cycling74.com/nodeformax/api/index.html>

About Node:

- <https://nodejs.org/en/>
- <https://www.npmjs.com>

EXAMPLES:

- face API connection with Max-> https://www.youtube.com/watch?v=Ud_XvmPlavU
- How to track human skeleton
- <https://mediapipe.dev>
Skeletontracking example – p5.js -> <https://editor.p5js.org/lingdong/sketches/ef6FB-uNq>
Handtracking example – p5.js -> <https://editor.p5js.org/lingdong/sketches/1viPqbRMv>

Node for Max Resources

- Sublime - <https://www.sublimetext.com>
- atom.io - <https://atom.io>

How to add a node.js script in Max for Live

1. new Object -> node.script hello.js
2. Connect message Box -> script start
3. Create new js file hello.js at harddisk (same directory as M4L device)
4. Add following lines into the hello.js file

```
// include max-api -> is the connection to Max
const maxAPI = require('max-api');
// print Message -> "Hello from Node.js" to Max-Console
maxAPI.post("Hello from Node.js");
```

5. Trigger message Box "script start"
6. Check if you get a message at Max Console

Node.js – Basics

Add a handler:

```
// a handler for receiving a message with a value e.g. "slider 60"
maxAPI.addHandler('slider', (value) => {
  //print value
  maxAPI.post(value);
});

// a handler for receiving a message without a value
maxAPI.addHandler('generateRandomNumber', () => {
  let rand_value = Math.random()
  maxAPI.post(rand_value);
});
```

Create a connection to the outside:

```
// send a message "random_value 0.234" to the outlet
maxAPI.outlet('random_value', 0.234);

// print "Hello" to Max Console
maxAPI.post("Hello");
```

Create a function:

```
function calc() {
  //do some calculations
}
```

Creating a variable:

```
let value = 10;
```

Debugging:

- use node.debug Object and connect it to the most right outlet of

EXERCISE: create a new node.js script which receives 2 values and multiply these values when one value will be received. Output the result as a message "result 6" if the input was 2 and 3

Javascript Cheatsheet

P5.js Getting started:

- <https://p5js.org/get-started/>

Create UI:

BASIC -> <https://p5js.org/examples/dom-slider.html>
MULTITOUCH .> <https://github.com/L05/p5.touchgui>

WEBSERVER

Definition: https://en.wikipedia.org/wiki/Web_server

If you need a Webserver for experiments you can use python.

To start a webserver run the command below:

`python3 -m http.server`

That will open a webserver on port 8080. You can then open your browser at <http://127.0.0.1:8080/> The webserver is also accessible over the network using your 192.168.-.- address. This is a default server that you can use to download files from the machine.

In class:

- Get access to p5 files from the Webserver
- get acces to files via smartphone

CREATING a NODE.JS WEBSERVER WITH EXPRESS

Addaptod from Daniel Shiffman: <https://www.youtube.com/watch?v=2hhEOGXcCvg>

1. Install Node.JS
 1. Windows - <https://nodejs.org/en/download/package-manager/#windows>
 2. MAC - <https://nodejs.org/en/download/package-manager/#macos>
2. Check if node.js is installed
 - OPEN your Terminal and type
 - node -v
3. Check if npm is installed and type
 - npm -v
4. Create a folder "server"
5. Change directory to server
6. Create a file -> server.js
7. Type command -> npm init(setup a configuration file package.json)
8. npm install express — save (install express Webserver and add dependency in package.json)
9. Add following lines into server.js

```
//create webserver and listen at port 3000
var express = require('express');
var app = express();
// listen at port 3000
var server = app.listen(3000);
// make all files in directory public accessible (these files are static files, index.html. jsfiles, media)
app.use(express.static('public'));
// print message at Terminal
console.log("socket server is running");
```

10. Execute browser with url -> <http://localhost:3000>
11. Create directory "public" in directory "server"
12. Add index.html and p5.js files in public directory
13. Test with url if public content will be loaded
14. Install Websocket package socket.io
 - npm install socket.io — save
15. Add web socket code to server.js

```
//create websocket
var socket = require('socket.io');
//add server to the socket
var io = socket(server);
//deal with events - in these case "connection" and call a function when connection is working
io.sockets.on('connection', newConnection);
```

16. Add socket client library to index.html file
 - <https://socket.io/docs/v4/client-api/>
 - <script src="/socket.io/socket.io.js"></script>
17. Create the connection from the client to the server and add following lines in sketch.js
 - var socket;
 - in setup function > socket = io.connect('http://localhost:3000');

18. Add code that you can communicate with the server in sketch.js

```
//create socket connection
var socket;

var websocket_msg = {
  name: '',
  value: null
}
sendWebSocketMSG(websocket_msg);

function sendWebSocketMSG(data) {
  socket.emit('msg', data);
}
```

Comment: value could also be a complex data set like

```
mouse_data = {
  x: 0,
  y: 0
}

mouse_data.x = 23;
mouse_data.y = 60;
```

19. Add code to your server (server.js) for receiving messages from the client

```
function newConnection(socket) {
  console.log('new connection: ' + socket.id);

  socket.on('msg', getMsg);

  function getMsg(data) {

    if (DEBUG) {
      console.log(data);
    }

    if (data.name == 'mouse_data') {
    }
    socket.broadcast.emit('msg', data);
  }
}
```

ALTERNATIV INSTRUCTION:

- <https://hostadvice.com/how-to/how-to-create-a-simple-web-server-using-node-js-and-express/>

Receive values in m4l

OPEN > websocket_interface.amxd

Install dependencies > trigger following message boxes

script npm init

script npm install socket.io-client --save

Toggle > START

USAGE

EXAMPLE: EXHIBITION

COMPUTER IS IN THE EXHIBITION WEBSERVER IS RUNNING ON THAT COMPUTER
